

Dedupe check

Captured, 8 October 2026. The redundancy and duplication cleanup, branch dedupe, merged as PR #55 and deployed.

Summary

Every approved finding from the redundancy scan was made, in 17 commits, about 300 lines fewer overall even with new tests. Everything still works: every check below passed. Two bugs were found and fixed on the way, one of them already present on main. The only failures seen along the way were the test scripts' own mistakes and a slow machine, each traced and confirmed below.

What changed

- **Shared once instead of copied:** list store import and backup-list reading (`importInto`, `parseList`); the word and phrase forms' fields (`ItemFields.tsx`); list pages (`ListPage.tsx`); detail pages (`DetailShell.tsx`); the tutor routes (`tutorRoute.ts`); the sign-in link routes (`authLink.ts`); rule and password checks (`ruleProblem`, `passwordProblem`); the backup dialogs; Settings list sections and language pickers; menu dismissal (`useDismiss`); deck building (`useBuildDeck`).
- **Native dialog:** `Modal` is a browser `<dialog>`, so the page behind it is inert and focus stays inside.
- **Removed:** dead code and unused exports, the `ANON_KEY` fallback (Vercel sets only the publishable key), the `vite-tsconfig-paths` dependency. Old docs moved to `Docs/history/`; the local edge runtime is off.
- **Skipped on purpose:** the three rename helpers (each documents its database function), the `display-name` field (behaves differently from the field it resembles), and the loading wrappers on seven pages (not provably safe to remove).

Results

Check	How	Result
Type check, lint	<code>npx tsc --noEmit, npx eslint src/ e2e/</code>	Pass
Unit tests	<code>npx vitest run</code>	846 of 846 (70 files)
Shared import routine	New tests, then each of its four writes broken on purpose	Every break caught
Production build	<code>npm run build</code>	Pass; route table unchanged, every workspace page server-rendered
End-to-end suite	<code>npm run e2e</code> on the local stack	8 of 8
Every workspace page	Nine pages loaded, console watched	No page or console errors

Native dialog	Cursor in first field; Escape; drag from card to backdrop; backdrop press	Focused; closes; stays open; closes
Escape in a Ref field's suggestions	First Escape, then second	List closes, then dialog (fixed; on main one Escape closed both)
Add finds a saved word	Open it for editing, rename onto another saved word	Real Edit dialog with the typed note; clash refused (fixed; used to fail in the database)
List sort and search, word page	Sort by Word, search, open the word	Pass
Export and Import	Export dialog; import a two-word file	"2 words: 1 new to you, 1 of your N already saved", three modes
Settings and delete	Studied language; select all and delete	Pass, through the shared confirm
Tutor conversations	Open, tick, search, rename, delete (new shared confirm)	Pass
Real tutor	Two questions, merge into a rule, save, search (live-check.spec.ts)	Pass
Live site after deploy	Signed out: landing, sign-in, sign-up, protected pages, search route	200s; protected pages redirect to /; search route 401

Failures along the way, and what they were

- **Local database stopped during start-up:** the machine was slow, health checks timed out and the CLI tore the stack down. Restarted; data intact.
- **Sign-in and conversation search over the 5-second limit:** the page still showed "Signing in..."; the search took 4.6 to 4.9 s against 3.5 s on main, mostly the embedding call. The same test passed on main, and passed on the branch with a 20-second limit, including the new delete confirm. Timing, not code.
- **Leftover data:** two real conversations from the morning's tutor check matched the conversation test's search; removed from the local database.
- **The test's own mistakes:** an empty list's button reads "Add your first word"; two comboboxes in the form; Backup's entries are menu items. Fixed in the saved test.
- **Escape in the Ref field:** a real bug, confirmed on main with a small test, fixed in Modal and confirmed by the same test.

Visible changes to expect

- Deleting a tutor conversation uses the shared confirm: red Delete, "This cannot be undone".
- Editing from Add Word is titled "Edit word"; the import mode cards are spaced slightly tighter; the Settings pencil matches the others.

- Not tested by script: signing in on the live site (captcha). Worth a look: a dialog's Escape and outside click, and Escape in a Ref field's list.

The test

Reports/2026-10-08-dedupe-check/dedupe-check.spec.ts, outside e2e/ so npm run e2e never runs it; the file says how to run it again. The real tutor part is Reports/2026-10-08-rename-check/live-check.spec.ts, run again unchanged.

Setup used

- Local Supabase stack, a temporary .env.development.local with the Turnstile site key empty, as CLAUDE.md describes; removed afterwards.
- Account e2e@local.test, paid in the local account_plans only.
