

Rename check

Captured, 8 October 2026. After the project folder was renamed from Sprint2_Project_Captured to Captured.

Summary

The rename broke nothing. Every check passed, including the tutor's AI features run against the real model. One existing timing issue in the tutor was found; it is not caused by the rename and is recorded in HANDOFF.md.

What changed with the rename

- Local Supabase project_id is now Captured, so the containers are supabase_*_Captured and the local database started empty.
- The multi-user test scripts, their README, the plans in Docs/plans/, HANDOFF.md and the notebook brief name the new container.
- start-app.cmd and the package name say Captured.
- The remaining definition-capture names (domain, repository, Vercel project, backup tag, IndexedDB name) are left for later; HANDOFF.md has the plan.

Results

Check	How	Result
Type check	npx tsc --noEmit	Pass
Lint	npx eslint src/	Pass
Unit tests	npx vitest run	844 of 844 passed (70 files)
Production build	npm run build	Pass; every workspace page still server-rendered
Local database	npx supabase start under the new project id	Every migration applied to an empty database
Sign-up	New account through /sign-up on localhost	Created, landed on Home
Signed-out access	Request /vocabulary and /home with no session	Redirected to the landing page
End-to-end suite	npm run e2e on localhost	8 of 8 passed
Every workspace page	Home, Vocabulary, Phrases, Verbs, Verb practice, Grammar, Flashcards, Tutor, Settings	All loaded, no page or console errors

Tutor answers (real model)	Two German grammar questions	Both answered in German with Duden sources, saved; allowance 28 to 26
Tutor merge (real model)	Tick both answers, Make one rule, Save	Merged rule saved and listed on Grammar
Tutor search (real embeddings)	Search conversations for "Akkusativ Präpositionen"	200, both conversations found
Fast follow-up question	Second question sent within a second of the first answer	Answer saved but not shown until reload (existing issue)

The timing issue

In a new conversation, the page moves to the conversation's own address about a second after the first answer arrives. That move rebuilds the chat from the server's copy. A second question sent before the move finishes is answered and saved, but the rebuilt chat lacks it, so it appears only after a reload. Nothing is lost, and a person is unlikely to type that fast. Waiting for the move made the test pass, which confirmed the cause. Not fixed.

The test

Reports/2026-10-08-rename-check/live-check.spec.ts. It stays outside e2e/ so `npm run e2e` never runs it, since it costs about six paid AI calls each time. The file says how to run it again.

Setup used

- Local Supabase stack, with a temporary `.env.development.local` and the Turnstile site key empty, as `CLAUDE.md` describes; removed afterwards.
- Account `e2e@local.test`, marked paid in the local `account_plans` only.
- Model: the default tutor model through OpenRouter, with the key from `.env.local`.
